

Part 2 - Codebase Selection

Mihir Patel & Mir Patel

Selected: Candidate 4: Project 2 — Jaredburne47/4150ReadRight (readright_app)

Why This One:

- Project 2 is the strongest foundation for improving the speech pillar because real Azure pronunciation scoring is already built and working and choosing Project 1 would mean building cloud speech assessment from scratch.
- Most of the app is already built, with a working teacher dashboard, class management, and an accessibility system that are already in place, giving us a solid foundation to add the AI story builder and Dolch sight-word games on top of.
- The problems are small and fixable. Every weakness identified in Part 1 for this project which is the broken fallback, debug print statements, the fixed 3-second recording window is a single-file fix, not a structural rewrite.

Why Not the Others

Why not Project 1 (ngmille/readright)

Project 1 has the cleanest architecture of the three, but it has no real pronunciation scoring at all. The entire cloud speech integration would need to be built from scratch. That is too large a lift on top of everything else the project requires, and its iOS-only styling would also need a full redesign for Android and Chromebook classrooms.

Why not Project 3 (ZhongTheKong/read_right_project)

Project 3 also has real Azure scoring, making it a closer call than Project 1. It was not selected because its single-JSON-file data model is a real scaling risk as the app grows, and its own README documents an unresolved Windows recording bug that could directly affect the team's ability to demo a working build.

Honest Tradeoffs

- **Gaining:** a working cloud pronunciation pipeline, a complete teacher dashboard, the best test coverage of the three, and an existing accessibility system.
- **Accepting:** the offline fallback currently scores everything as zero, which needs to be fixed in Milestone 2 before any real student can use the app reliably.
- **Accepting:** the 3-second hardcoded recording window and leftover debug print statements are small issues, but both need to be cleaned up early since they directly affect scoring quality.
